

1 Sample the recording

Open a recorded Instagram Reel.
Sample frames from the start and the end.
Resize each frame to 540×960 pixels.
Laptop test: 2 sampled frames per second.

2 Find and crop the account name

Detect a profile-picture circle in the lower-left search region.

thestoryofourhome.pl

Crop the text to its right.

If no circle is found, continue to the next sampled frame.

3 Read the cropped text in both directions

Pass	Frame order	EasyOCR and repeated readings
Forward	Start $\longrightarrow$ later frames	Read names; count one vote per name per frame.
Reverse	End $\longrightarrow$ earlier frames	Repeat independently from the other end of the clip.

Laptop test: stop each pass at 3 votes, or after 12 sampled frames. Keep raw text, confidence and frame numbers.

4 Compare the names and inspect the result

Matching readings: agreement. Different spellings, missing names or weak support: flag for review.

Save CSV and JSON results, an Excel table, and an HTML page with crops at 1 s, 3 s and one second before the end.

For the included clip, compare the detected text with `thestoryofourhome.pl`, including the dot before `pl`.
